ABOUT

Graduate of the College of High Technologies at BSTU named after V. G. Shukhov, Information Systems and Programming. I build websites, web applications, and automation for routine processes. I use AI tools as a production stack: I own the problem framing, decomposition, business logic, and edge cases myself — the code generation is done by AI under my control and review. This lets me ship a working result faster than classic development. I have completed projects for external clients, one of them in daily production use.

KEY SKILLS

- ▶ **Web: frontend, backend, database** — HTML/CSS, responsive layout, dark theme; Python + Flask; database design and normalization, SQL
- ▶ **Routine process automation** — Node.js and Python pipelines, Google Sheets API, Telegram bots, parsing and data collection from external sources
- ▶ **Local AI models** — running and applying models via Ollama without cloud services, full-text and semantic search over data
- ▶ **AI development orchestration** — setting tasks for AI agents, controlling and accepting the result (Claude Code, Codex, local models)
- ▶ **Systems analysis** — software lifecycle, UML diagrams, spotting ambiguities in requirements before implementation
- ▶ **Tools** — Git/GitHub, GitHub Actions, deployment to GitHub Pages and Vercel, PowerShell

PROJECTS

College admission campaign automation (2026) — github.com/Mloop13/Priemka

A pipeline for the daily rebuild of the admission table: an export from the record-keeping system (up to 1,500 applications, 30+ columns with personal data) is distributed into a de-identified ranking across 14 specialty sheets. Personal data filtering by whitelist, idempotent rebuild, automatic highlighting of benefit holders, preservation of manually entered grades, edge-case handling. Manual work dropped from hours to seconds. Since July 2026 the table is updated by an admission office staff member independently, without the developer.

Stack: Node.js, Google Sheets API v4, PowerShell

Website for "M 207 Soft" — medical software vendor, Belgorod (2026) — mloop13.github.io/m207soft

A turnkey business-card site with a product catalog for an external client: requirements and materials gathering, a brand system built around the logo, responsive layout, dark theme, iteration rounds with the client.

Stack: HTML, CSS, GitHub Pages

"MedCenter" web app — online booking system (capstone project, 2026)

A multi-page application: registration and authentication, a catalog of specialists and procedures, online appointment booking, a personal account with visit history. Database and business-logic design.

Stack: Python, Flask, SQLite, Bootstrap

job-watcher — job monitoring bot (2026)

A Telegram bot: collecting job postings from several sources (Telegram channels, Habr RSS, the Russian public job registry API), keyword filtering, deduplication, notifications.

Stack: Python, Telegram Bot API, RSS

Personal agent infrastructure (2026, R&D)

A system of daily digests and logging built on Claude Code hooks: collecting data from Google Sheets and news sources, delivery to Telegram, an Obsidian knowledge base with full-text and semantic search.

Stack: Claude Code, PowerShell, Telegram Bot API, SQLite FTS5, Ollama

EXPERIENCE

Freelance — technical work on request (2024–2026). Completing technical assignments with AI tools. All orders delivered and paid, clients came through referrals.

EDUCATION

College of High Technologies at BSTU named after V. G. Shukhov, specialty 09.02.07 "Information Systems and Programming", 2022–2026 — diploma defended.
