

Sergey Timoshenko

Junior developer: web and process automation

Russia ithakawork@gmail.com @ithaka_of github.com/ithaka-of ithaka-of.github.io/Finaly_Site

◆ ABOUT ◆

Graduate of the College of High Technologies at BSTU (Belgorod), majoring in Information Systems and Programming. I build websites, web applications and automation for routine business processes.

One of my projects has been in daily production use since July 2026: the college admissions office now updates its ranking spreadsheet on its own, without me. A manual operation that used to take hours now takes seconds.

I treat AI tools as a production stack: framing the task, breaking it down, owning the business logic and the edge cases — that part is mine; code generation is the model's; verifying the result is mine again. That is how I ship working results faster than by writing everything by hand.

◆ CORE SKILLS ◆

Web: frontend, backend, database — HTML/CSS, responsive layout, dark theme; Python + Flask; database design and normalisation, SQL

Process automation — Node.js and Python pipelines, Google Sheets API, Telegram bots, scraping and data collection from external sources

Local AI models — running and applying models via Ollama with no cloud services, full-text and semantic search over data

Directing AI and reviewing its output — task decomposition, edge-case control, verification of generated results (Claude Code, Codex, local models)

Systems analysis — software lifecycle, UML diagrams, spotting ambiguity in requirements before implementation

Tooling — Git/GitHub, GitHub Actions, deployment to GitHub Pages and Vercel, PowerShell

◆ PROJECTS ◆

College admissions campaign automation

github.com/ithaka-of/Priemka

A pipeline that rebuilds the admissions spreadsheet daily: an export from the record system (over 1,000 applications, 30+ columns containing personal data) is redistributed into an anonymised ranking across 14 per-programme sheets. Whitelist-based filtering of personal data, idempotent rebuilds, automatic flagging of applicants with legal priority, preservation of manually entered scores. I owned the business logic and the edge cases: a missing programme sheet, the "Withdrawn" status, conflicting payment types — I found these myself rather than the client finding them after a failure.

Result: Manual work dropped from hours to seconds; since July 2026 an admissions officer updates the spreadsheet without any developer involved.

Stack: Node.js, Google Sheets API v4, PowerShell

Corporate website for M 207 Soft — medical software vendor, Belgorod

ithaka-of.github.io/m207soft

A company website with a product catalogue for an external client. My role: gathering requirements and materials, writing the specification, building the visual identity around the logo, reviewing the result and running revision rounds with the client. Implementation was carried out with AI tools under my supervision.

Stack: HTML, CSS, GitHub Pages

MedCenter — online appointment booking web app — graduation project

45.12.239.170

A multi-page application: sign-up and authentication, catalogue of specialists and procedures, online appointment booking, personal area with visit history. Database and business logic designed by me. Deployed on my own VPS.

Stack: Python, Flask, SQLite, Bootstrap

job-watcher — job posting monitoring bot

A Telegram bot that collects job postings from several sources (Telegram channels, Habr RSS, the Russian federal employment API), filters them by keywords, deduplicates and sends notifications. Runs daily.

Stack: Python, Telegram Bot API, RSS

Personal agent infrastructure — R&D

A system for daily briefings and session logging: data collection from Google Sheets and news sources, delivery to Telegram, a knowledge base with full-text and semantic search. Running since July 2026 without manual intervention.

Stack: Claude Code, PowerShell, Telegram Bot API, SQLite FTS5, Ollama

◆ EXPERIENCE ◆

Freelance — technical work on commission (2024–2026)

Delivering technical assignments with AI tools. Every order was completed and paid for; clients came through referrals.

◆ EDUCATION ◆

College of High Technologies at BSTU, Belgorod — Information Systems and Programming, 2022–2026 — diploma defended

BSTU named after V. G. Shukhov — BSc in Information Systems and Technologies, accelerated programme, from September 2026

Yandex School of Data Analysis — AI Agents Security Week intensive, 27–31 July 2026 — certificate. Hands-on work on AI agent security: testing guardrails and defending against system prompt extraction
